

Preparing for Home Grow

Fundamentals of Growing Cannabis

EQUIPMENT CHECKLIST

Germination, Seedling, Vegetative	
	pH Strips or pH Meter: Needed to measure the pH of water and runoff water.
	4" x 4" Pots: Recommended for starting seedlings.
	3,5, or 10 Gallon Air Pots or Root Pouches: Needed for transplanting seedling when ready. Size of the pot will depend on anticipated size of the plant.
	Catch Trays: Place underneath the pot to catch excess water.
	Potting Soil: Potting soil for starting of seedlings. A pre-mixed potting soil is recommended for the first 4-5 weeks of growth.
	Nutrients for Vegetative Stage: Pre-mixed nutrients for vegetative growth (e.g., N-P-K ratio of 9-3-1) or individual nutrients to create your own mix.
	Other Soil Amendments: May include worm castings, other manures, and compost to provide a combination of macro and micro nutrients to the plant.
	Small Pruning Shears or Scissors: Needed to actively prune the plant. Keep sterile.
	String and Clothespins: Will be needed if using low stress training technique.
	Spray Bottle(s): For creating foliar spray to fight pests or slightly wetting soil during germination.
	Propagation Tray (optional): May be used during seedling stage if higher humidity is desired. Needed if attempting to develop clones.
	Heating Mat (optional): May be necessary to keep seedlings warm if growing in a colder environment or during the winter months.
